

CafeSuite: How to install CafeSuite?

Here are the basic steps necessary to install CafeSuite in your network:

1. Download the latest version of CafeSuite from [our website](#).
2. Run downloaded installation package on the main (server) computer. By default the software will be installed to c:/Program Files/CafeSuite folder, but you can change it. Application data will normally be installed to another directory displayed during installation.
3. Run CafeStation at the end of installation (or you'll find the shortcut in the CafeSuite group in Start menu).
When you will be asked to log in, select default boss user with empty password and press OK. This user has full permissions.
4. Configure main CafeStation software through menu Program/Options.
5. Configure client software through menu Program/Client setup. See: [What should I do to configure client software?](#)
6. Install client software on the workstations. See: [How to install client software on the workstations?](#)
