

CyberPrinter: Are network printers supported? How to configure network printer to work with CyberPrinter?

Support for network printers is a bit tricky:

1. First you should connect your printer to the network, if it's not already connected.
2. Install the printer **ONLY** on the main (server) computer.
3. Share the network printer installed on the main computer (workstations shouldn't communicate with network printer directly).
4. Install CyberPrinter on the server and workstations.

From now on, the printouts from the shared printer will be reported by CyberPrinter.
